

Motivation

There is no MobaXTerm for Mac, so here's how you configure your Mac to show those GUIs.

Get started

Install [homebrew \(Links to an external site.\)](#)[Links to an external site.](#) then install XQuartz:

```
brew cask install xquartz
```

Open XQuartz by searching for it in Spotlight. It should be white terminal window, as shown in the picture above. Inside of the XQuartz terminal, connect to the UCI servers:

```
ssh -X [UCInet ID]@zuma.eecs.uci.edu
```

For example, this is what I run:

```
ssh -X sbalana@zuma.eecs.uci.edu
```

Then it connects as usual. Done. Any commands that run a GUI will now launch on your Mac.

Credit goes to Sam Balana.
